Acknowledgements

I am forever grateful to Almighty God for being my strength, my fortress, my redeemer. My parents for being supportive of this endeavour I have been called to pursue and my course mates for endless support along the way. Throughout the experience of postgraduate studies at The Open University, I have been supported by several internal departments, external organisations and numerous people in academia who have worked endlessly to craft my critical understanding of Human Resources and who have helped define my research topic around employee wellbeing. These include Library Research Support, Student Support and of course my former lecturers and current tutors. I would also like to take this opportunity to convey my gratitude and a tremendous thank you to all of those who have helped finance my learning and research endeavours, either through tuition loans or grants, particularly I would like to draw attention to the efforts of Student Finance England (SFE) and the Open University Student Budget Account (OUSBA) who have helped me settle in and funded my pursuit throughout my time as a postgraduate student.

The TMA 1 assignment began here – Revisions are included

1.11 Outline of the Topic

Though there are no doubt an immense amount of synergy and efficiency gains from the adoption of Artificial Intelligence ('AI') and its proponents, the process of achieving results and the result itself has been deemed a threat to society by the author of a recent House of Lords Library report.

This opportunity to prepare a MSc dissertation thesis all emerged because of the Buckland Review which was commissioned by **Sir Robert Buckland QC** (the long-serving former UK Cabinet Minister and former MP for South Swindon) and Autistica in early 2024 under the leadership of the then Conservative Prime Minister, the Rt. Hon Rishi Sunak. Since the end of the Conservative Party's 14-year tenure in office, the rise in what has come to be known as Artificial General Intelligence or AGI, which forms part of the idea that there may in fact may be a Singularity in the near future, has produced various "sides" of this perceived eventuality. On the one hand there are proponents who advocate for AGI and on the other there are naysayers.

Since the outcome of the Buckland Review and its subsequent findings concerning the employment opportunities of Autistic applicants (that is, **7 in 10** are not in gainful employment across the country), further research has been conducted by Miller and Doyle (2025) which forms the basis of how to *deconstruct* the various approaches taken by employers when attracting these aforementioned and completely hypothetical 7 in 10 neurodiverse applicants who are unemployed during recruitment activities, without employing specific and targeted recruitment campaigns which require candidates to come forward and identify their conditions at the outset of the process. Dr. Nancy Doyle is a prolific campaigner for neurodivergence in the workplace who has previously written an online opinion piece for Genius Within, a UK community interest company, on the subject of the **Sir Charlie Mayfield** Review (Doyle, 2025).

The aforementioned is important for several reasons, not least for the intrinsic motivation of the employee but also on grounds of fairness and positive discrimination. I am aiming to study how neurodiverse applicants perceive resource-based HRM (what we call the RBV in HRM theory) and how RBV approaches, which are inherently focused on creating competitive advantage link to recruitment signalling during the applicant journey. I am hoping to investigate several hypotheses (which I have cited in my PhD proposal) which will form the backbone of the research study, and which will either confirm the work of **Miller and Doyle (2025)** or reject the premise of their recent research study. I also plan to extend Miller and Doyle's work to study anonymous responses from applicants with bipolar disorder (a condition that is **widely considered** as neurodivergent but was omitted from their empirical study).

1.12 Introduction

Given that recent research demonstrates how neuroinclusive teams can be 30% more productive than those which do not include neurodiverse employees (NatWest Mentor, 2025), and with Gen Z entering the workforce – over 50% of whom have some sort of neurodivergent condition² - either Autism Spectrum Disorder or Bipolar Disorder (Forbes Magazine, 2025), the broad research topic I have selected to follow for this module is a contemporary problem with its roots in a recent report (Youth Future's Foundation, 2025). As an interdisciplinary topic, this thesis is partly covered by *signalling* (psychology), *applicant attraction* (HRM), *employee wellbeing* (HRM) and *labour market analysis* (game theory).

As I am deeply intrigued by the sort of opportunities available to young and neurodiverse job applicants and how these opportunities are perceived by those who apply, I have chosen a topic that investigates an instance and prevalent gap in the literature on hiring technology and perceptions of website recruitment processes by neurodiverse applicants (Miller and Doyle, 2025). I have devised a set of five hypothesis to outline the direction which I would like the research to follow, and which resulted in the research question I have settled on.

1.13 Research Methodology

For this Masters' thesis, I will be aiming to build on the MSc in HRM research study (which applies a sentiment analysis and a questionnaire approach) by conducting empirical analysis of a diverse range of data sets including non-sensitive HR data from companies. The research questionnaire is available (in draft) to view [here](#) and resumes the research topic where (Miller and Doyle, 2025) ended, although the topic of discussion has been realigned to include artificial intelligence, the fundamental assertions are the same. The following hypotheses are subject to supervisory changes and will be honed and amended as and when new information in the literature is discovered, reviewed and internalised. In order, these initial hypotheses read as follows:

- Hypothesis 1:** Firms with resource-based HRM practices signal *more* in successful applicant "journeys"
- Hypothesis 2:** Firms who signal more, also spend more annually on recruitment processes
- Hypothesis 3:** Firms with higher net spend "bundles" enable rather than deter neurodiverse applicants
- Hypothesis 4:** Neurodivergent applicants judge recruitment favourably compared to other colleagues
- Hypothesis 5:** Firms having lower net spend signal less resource-based HRM practices

These hypotheses refer to the research designed by Chang and Chin (2018) in their paper on online ratings and signalling and act as a starting point for further hypotheses. The theories which underpin this interdisciplinary topic can be traced back from its applied influences in HRM to what Guest (2021) refers to as *attribution theory* – the theory of psychology which explains how behaviour is understood as a consequence of one's environment. I will aim to investigate how signalling (Spence, 1973) affects situational attribution theory, and how it is thereby relevant to *applicant attraction* of neurodiverse candidates (Celani and Singh, 2011). I have since applied for the PhD at the Open University and the research question I have submitted can be drafted as:

"Signalling and Neurodiversity: Do firm SHRM choices substantially influence candidate perceptions of the applicant journey? An empirical analysis"

1.14 The Topic's Importance to the Literature

The importance of this research topic cannot be understated. Specifically, the topic is important because it seeks to enquire into how diverse job applicants perceive their roles in the organization *prior to* being onboarded as employees (in other words, it asks how *neurodiverse* applicants interact as job candidates) through the proxy of website recruiting activities. The seminal applied instance of this research topic is the online ratings and HRM signalling paper pioneered by Chang and Chin (2018) who test evidence to investigate the hypothesis that three things are likely to occur prior to onboarding:

1. A high-commitment HRM strategy is pursued and that firms conduct recruitment via a website

² I define two specific conditions in-scope of this study: Autism and Bipolar Disorder.

2. The firm may initiate a signal to the receiver via this website about its high-commitment HRM strategy
3. This signal initiates an effect on the employees' online ratings.

As such, the authors (Chang and Chin, 2018) argue for five important hypotheses which form the starting point for this study:

- 1) Firms with more high-commitment HRM will signal more HRM information on websites
- 2) Firms signalling more HRM information on websites will experience a trend of more applications
- 3) Firms' signalling of HRM information on websites fully mediates the effect of the firms' commitment HRM on recruitment
- 4) Firms' actual HRM influences employees after experience outcomes such that firms' commitment HRM will increase online ratings
- 5) Firms' signalling of HRM will not increase an employees' online ratings if the effect of commitment HRM (on recruitment) is controlled

My research will aim to extend a gap on this topic by focusing on firm expenditure, capabilities and resources, asking a question not currently addressed by the literature on signalling – how these factors affect competitive advantage given the specific context of attribution theory (Guest, 2021). As such, there are at least three forms of data will be required to accomplish the task of addressing the question:

1. Data on HRM signals from recruitment websites and publicly available announcements
2. Data drawn from surveys on how neurodiverse applicants perceive signals on recruitment websites
3. Data on how firms spend on recruitment websites

1.15 Timeline for Completion and Next Steps

Out of scope: I will be conducting a literature review for B894 which will be completed in February 2026, I do not intend to look at any sort of data or make any requests for data access until ethical approval has been given for my MSc research question and methodological design.

Within Scope: I will begin to map the hypotheses using sources such as Overton.io and others that have been identified; and assuming the research question can be scrutinised on an ongoing basis, it will then be possible to review the available literature, filter through and arrange such information into formats which will allow me to revise the hypotheses (cited above), and hopefully make use of both quantitative methods such as sentiment analysis and indeed qualitative analysis such as a survey or questionnaire.

The TMA 2 assignment begins here

1.16 Introduction to TMA 2 – Literature Review

As SHRM (specifically, RBV) is a very interdisciplinary subject when it comes to research that defines theory - I will be sourcing information on the following subtopics from three highly reliable contemporary literature sources (JSTOR, The Open University Library and Google Scholar). My intention is to source academic peer-reviewed literature published roughly between 2010 – 2025 in terms of timelines (the literature effectively narrates on the problem which can be traced back to about 2011 in reports so, there's about a 8–10-year gap where the problem surfaces and the seminal papers focused on analysing the problem begin to emerge in the literature). However, there may be exceptions to this timeline as per the theoretical work of Coles and Treble (1993) or the earlier theoretical work by Rynes and Barber (1990). Though the three selected sources indeed do store great literature on each subtopic, I may require policy infographics, charts and vital published statistics which will also be important to this study's objective. I will therefore be actively seeking NGO and government reports drawn from Overton.io, where such information may be found.

1.17 Mapping Relevant Subtopics

Recruitment and Selection: According to Sir Robert Buckland's Autism and Employment Review published alongside Autistica on the employment of sufferers on the ASD spectrum, only 3 in 10 people with ASD are gainfully employed, the remaining 7 in 10 of the UK's population are unemployed or underemployed. This figure rises to 8 in 10 on a worldwide basis (Davies et. al. 2023).

Applicant Attraction: A recent study on applicant attraction by Dutta and Mishra (2021) have focused on Gen-Z and millennial generation cohorts in the context of the Indian sub-continent.

Signalling Theory: The seminal work on signalling is found in Spence (1973) however, since this paper was published there have been numerous attempts to assign and apply signalling theory to the context of the hiring process.

1.18 Conducting Gap Analysis – AI and its effect on HRM

AI as an umbrella term for concepts machine learning, NLP, computer vision and other key algorithmic concepts. Some gaps certainly do exist in the form of “*minimal information*” available concerning the effects of bipolar depression in later life (Depp and Jeste, 2004), one of the more pronounced gaps in the literature is the more recent focus on Artificial Intelligence (“AI”) and employment balances for neurodivergent neurotypical applicants (Mirowska and Arsenyan, 2025; Smith *et. al.*, 2025) which assumes the capture of those who suffer from Bipolar I or II. AI has been argued to carry the potential to promote or affect various types of diversity, to avoid the consequence of overexposure to unconscious biases, and to help design more comprehensive signalling approaches to attract talent, recruit and retain new employees and to develop an overarching organisational focus on *cultural* diversity more generally. According to an open access paper by Chilunjika, *et. al.* (2022), gaps exist in the research on AI's application to HRM in the public realm.

1.19 Concerns and Recommendations

One of the central propositions of this thesis is in regard to a context engineering exercise which the author developed over the course of a 3-week testing period. Whilst implementing the use of three key large language models 1) Google's Gemini 3.5, 2) Anthropic's Claude Haiku 3.5, and finally, 3) Claude Opus 4.5 (the latest iteration of Anthropic's market leading LLM). By prompting each model through an OAuth 2.0 API, much of the Afro-centric knowledge base it relies on was found to be deprecated. In one instance, when prompting the model for information about national days observed by African states during the testing period, Anthropic's model responded with a clarification message indicating it had limited knowledge and capacity to respond (after first recommending suggestions which were clearly improper – in this instance, themes observed which related to non-African countries).

If as many commentators have posited, Generative AI is seen to be a form of intelligence which learns how to complete a range of tasks on its own accord, then it therefore becomes clear that the trained data selection process which accompanies the large language model (in this case Claude Opus 4.5) should be disclosed as ethnically-unbiased, culturally-unbiased and as factually-diverse as possible.

Far be it for one so unlearned in the economics of computer science to make judgements about how Anthropic weights its algorithm, or how it decides upon its company's interests when competing with OpenAI and Google, but it should be a fundamental aim and commitment of these various organisations to ensure models are not misrepresented as omnipotent when the reality is somewhat of a shortfall from this. What is required, as the Dean of Oxford's Said Business School has recently suggested is a charter on artificial intelligence which outlines how its adoption and implementation should be overseen.

1.20 Explicating my Literature Review 1 – Applicant Attraction

As part of the planning process, I shall spend time gathering articles from a number of relevant online databases which host peer-reviewed journals. These are listed below under the “Source” column. I plan to gather a **minimum** of five articles from each of the clear *subtopics*, acting as search protocol and using the jigsaw format as structure (University of Hull Library, 2025).

1. Applicant Attraction

Source	Name of Journal / Book	Scoped Articles
Emerald	Personnel Review	Celani and Singh (2011)
JSTOR	Academy of Management Review	Rynes and Barber (1990)

2. Neurodiversity (Bipolar and Autism - Diversity and Inclusion)

Source	Name of Journal / Book	Scoped Articles
Wiley Online	The Scandinavian Journal of Economics	Sarsons (2024)
Emerald	Personnel Review	Dutta & Adsule (2025)
Wiley Online	Human Resource Management	Lup and Canonico (2024)
Sage Journals	Autism	Davies et. al. (2023)

3. Recruitment and Selection (Game Theory and Signalling Theory)

Source	Name of Journal / Book	Scoped Articles
Emerald	Personnel Review	Younis & Hammad (2021)
Wiley Online	The Scandinavian Journal of Economics	Barmby, Sessions & Treble (1994)
Elsevier	Labour Economics	Coles & Treble (1993)
Elsevier	Economic Letters	Coles & Treble (1996)

Emerald	Personnel Review	Celani & Singh (2011)
Wiley Online	Journal of Occupational & Org Psychology	Miller & Doyle (2025)
Wiley Online	Human Resource Management Journal	Guest et. al. (2021)
Elsevier	Journal of Business Research	Chang & Chin (2018)
JSTOR	The Academy of Management Review	Bowen & Ostroff (2004)
JSTOR	The Quarterly Journal of Economics	Spence (1973)
Wisconsin.edu	Master of Science (Psychology) Dissertation	Wright (2010)
EBSCO Host	Academy of Management Journal	Jones et. al. (2014)

1.21 Explicating my Literature Review 2 – Signalling Theory

Key question: What is the sub-game optimal (in a game of separating or pooling equilibrium) signal an employer should send to applicants in order to be neuroinclusive? Also, at what level of signal does an employer who signals acceptance of a neurodiverse condition, become accepted by a neurodiverse applicant?

Spence (1973): Theoretical Article on Signalling Theory

Here, in the view of Spence (1973) the notion of hiring is compared to the act of buying a lottery ticket, which itself is a problematic notion due to the euphemisms of loss being invoked. This act of adopting such a gamble is best described per a model composed by Brown and Sessions (2004). Spence argues that there is often an element of informational asymmetry pertaining to full knowledge of the average worker’s capability in the job prior to such a lottery concept being invoked. Assuming the lottery concept is associated with information that is rarely fully disseminated, an employer’s perception of this lottery

gamble is what Spence (1973) defines as a “primary interest” due to the uncertainty involved in making the proposed hire when weighed against the wages offered by the employer to the worker as compensation for services rendered. When discussing the lottery, we speak here of a singular instance of a repeated game. The terms of reference adhered to by Spence, constitute very strict and formal belief system for his term sheet mapping the employer’s perception of the lottery process. There are two kinds of observable attributes mentioned in Spence’s article: Indices and signals (Spence, 1973; p. 357). The term “indices” refers to “immutable” attributes observed by the employer amongst participants in the hiring ‘lottery’, attributes such as race or sex. This is followed closely by the term “signals”, which references alterable attributes or those which can be manipulated by the candidate, such as education and experience. For the purposes of Spence’s research, age is considered as an alterable attribute and is therefore seen to be an index. Signals and indices are seen to be “parameters” in the conditional probability distribution reflecting the “beliefs” of an employer.

Miller and Doyle (2025): Empirical Article

Navigating this landscape of DEI in recruitment can be oftentimes a complex pursuit. Upon reflection with some experience and exposure of high-level dialogue gained through the Business in the Community (BITC) Opening Doors program, it’s fair and proper for me as an author to infer proportionality. By this I mean the idea that work is a lottery is unfortunately not an appropriate lens to view employment dynamics. Much of the work found in the recommendations of the 2024 Autistica report authored in collaboration with Sir Robert Buckland KC can be supported by academic literature. If the Autistica report identifies the scenarios and problem faced by Autistic job applicants, then Miller and Doyle (2025) most certainly shed further light on this problematisation of a ‘lottery’ by providing what one might call a dialectical synthesis to the concerns highlighted in the report. According to Miller and Doyle (2025) the article mentions the theoretical framework of Khan et. al. (2023) whose literature review and empirical study on the topic is the only post-COVID era work used as authority, but the article also acknowledges that research in the area of inclusive signalling to neurodiverse applicants is relatively limited. Extending Khan et. al. (2023)’s ideas for further research in a HR context, Miller and Doyle apply a systems-based analysis of “signalling” theory (or rather a systematic approach based on academic literature) in the hiring and selection process to uncover a consummate view that the inclusion of the neurodiverse job applicant in the workplace is paramount. Both co-authors argue organisations should go *beyond* the business case for diversity in recruitment by making the process itself clearer. We can divide the approach for achieving such an eventuality as follows. Firstly, Miller and Doyle treatise an argument in favour of neuroinclusivity by encouraging proactivity from the employer. The line of thinking goes ~ if an employer provides a list of ‘frequently requested adjustments’ then this action is therefore a proactive signal to candidates who may require such adjustments to participate in the process. Likewise, by sufficiently educating recruitment staff and hiring managers involved in the act of recruitment and selection on what “neurodivergent behaviours” are, and by thereafter implementing a consequential action: prioritising diversity, equity and inclusion over the Spencian view of hiring as a lottery, we arrive at a mechanism which appreciates neurodiversity as a recruitment priority.

Celani and Singh (2011): Theoretical Article

Celani and Singh (2011) conduct an analysis of signalling theory from a multi-level perspective (contextual effects). By multi-level, one might interpret the meaning also as multi-hierarchical (affecting various modes of the organisation; navigating the macro-level, the meso-level, through to the individual-level) assessing how recruitment-related signals are seen to reveal unknown characteristics of organizations. The theory posited provides links between individual and organisation-level signals from recruitment activities. Links are made between market signals and instrumental or symbolic applicant inferences.

Celani and Singh (2011) conclude by challenging readers via invitation to study a gap in the signalling literature ~ signalling from a recruiter perspective i.e. from the organisation’s perspective. This means

to imply that the organisation (recruiter or hiring manager) does indeed perceive and internalise what Spence (1973) defines as ‘alterable’ attributes (for instance, the highest level of education signalled by the candidate or the candidate’s length of experience/number of promotions or career highlights). Signalling theory when viewed through the Spencian lens is therefore arguably either angst and menace on the one hand or catalyst and predictor on the other.

Chang and Chin (2018) Empirical Article

Here, the authors define signalling as the communication of unique information or rather “the sending out of information that competitors cannot easily imitate” analysing HRM signalling on each firm’s website over a three-year period. Signalling therefore becomes important in job markets where numerous employers compete to “*increase* market share”. Chang and Chin (2018) stress the importance of firm actions and **separating equilibrium** to this signalling dynamic.

Guest et.al. (2021) Empirical Article

David Guest studies staff in bank branches and defines signalling theory as “communication *by* and *within* an organisation”, in contrast to evidence from Laker *et. al.* (2025). Citing Bowen and Ostroff (2004) as part of an integrated framework to study attribution theory, Guest (2021) concludes that signalling theory is to be viewed as a “*distinctive*” approach to the HRM process. He acknowledges limitations of cross-sectional methodology and calls for longitudinal research approaches.

Bowen and Ostroff (2004)

The article by Bowen and Ostroff (2004) is one which touches upon multi-level relationships between HRM and organisational performance through psychological “climate” as an example of higher-order social structures (other examples include organisational culture and organisational role structure, and organisational sensemaking (which is a design thinking principle). (p.205). Bowen and Ostroff (2004) highlight the additional importance of “social context theory” where formal roles are defined by organisational systems and “maintenance subsystems”.

1.22 Explicating my Literature Review 3 – Recruitment & Selection

Key question: In a separating equilibrium, that is, in a sub-game perfect Bayesian repeated game with known payoffs, and standard assumptions (complete information and perfect monitoring), how do employers navigate a many-to-one “lottery” scenario, using the offered wage as signals as navigating mechanisms?

Coles & Treble (1993; 1996) are some of the key seminal works on the dynamics faced by the employer and the behaviour of the employer when faced with uncertainty.

1.23 Journal of Economic Literature (JEL) Classification

To navigate the literature, I shall be using several JEL codes to classify my MSc in HRM dissertation, these codes are:

JEL CODE	PRIMARY/SECONDARY CATEGORIES
J24	Human Capital; Skills; Occupational Choice; Labor Productivity
J71	Labor Discrimination
D82	Asymmetric and Private Information; Signalling
D83	Search; Learning; Information and Knowledge; Communication; Beliefs
D86	Economics of Contract: Theory
D90	Micro-Based Behavioural Economics
M51	Personnel Economics; Executive Compensation
M54	Labor Management; Industrial Relations
I12	Health Behaviour; Health Economics
