

Do SHRM Signalling Practices, Compared to Conventional HRM Approaches, Affect How Candidates Perceive the Employee Journey? Investigating the “Microeconomics of Inclusion” with Survey Evidence

Written by A.A.B. Mayaki

alfred.mayaki@ou.ac.uk

Supervised by Dr. Nicola J. Bowman

Module code and title: B894 – Dissertation (HRM)

Course title: MSc in Human Resource Management

Abstract

Using a participant survey, this paper investigates whether any correlation exists between the perceived attitudinal judgements of candidates about their employee journey, and the findings and data of a depression scale collected by Understanding Society. This paper assumes signalling practices are organizational cues intended to communicate the strategy to external applicants and internal employees. It studies responses using a two-staged least squared (2SLS) regression model.

1.10 Foreword & Acknowledgements

As a Pentecostal Christian, I am forever grateful to Almighty God the Father for being my strength, my fortress, my redeemer, to my parents for being supportive of this privileged endeavour I have been called to pursue and to my MSc in HRM course mate, Helen, for her endless support along the way. Throughout the experience of postgraduate studies at The Open University, I have been relentlessly supported by several internal departments, external organisations and numerous cohorts of people in academia who have worked endlessly to craft a critical understanding of Human Resource Management into my scholarship and who have helped define this research topic around neuro-inclusion and employee wellbeing. These departments include the people who make up Library Research Support, those working in Student Support and of course my former and current tutors at The Open University. I would like to take this opportunity to convey the sincerest of gratitude and a tremendous thank you to all of those who have helped finance my learning to date through journal access and concurrent research endeavours, events and conferences, either through tuition loans, bursaries or grants, But particularly, I would like to draw attention to the efforts of the OU's Student Finance England (SFE) team and the Open University Student Budget Account (OUSBA) team who have helped me settle in and funded my pursuit throughout my time as a postgraduate student. May God's great grace never cease to shine through all your lives.

The TMA 1 assignment began here – Revisions are included in red

1.11 Background to the Topic

In the age of AI's prominence and unprecedented influence on the nature of work and organization, it has become commonplace to query the format of existing systems and structures of hiring, communication, and allocation of work from firm to worker (Kolotilin et. al., 2024). One such structure is the work of Spence (1973) on signalling theory. Signalling theory is widely considered as the seminal field of Spence who offers a window into the origins of applicant behavioural incentives. Spence argues convincingly that when potential workers invest more in education, this signals to the employer that a higher wage is expected.

It is timely that this opportunity to prepare a MSc dissertation thesis has emerged, partly due to the recency of the Buckland Review which was published by Autistica in early 2024 under the leadership of the then Conservative Prime Minister, the Rt. Hon Rishi Sunak and partly due to the author's work as a Royal Economic Society independent researcher and Consultant Director, working alongside the Opening Doors Initiative (Business in the Community, 2026) to develop employment opportunities for people from disadvantaged communities across Britain. Since the end of the Conservative Party's 14-year tenure in office in 2024, the rise in what has come to be known as youth who are not in employment, education or training (NEETs, essentially) has somewhat subsided but since the outcome of the Buckland Review and its subsequent findings concerning the employment prospects for Autistic adults (that is, 7 in 10 are not in gainful employment across the country), further research has been conducted by Miller and Doyle (2025) which forms the basis of how employer's *deconstruct* the various approaches taken when attracting the aforementioned 7 in 10 adults with Autism as applicants to open roles and by accommodating their interest during recruitment activities, without employing specific and targeted recruitment campaigns which require candidates to come forward and identify their conditions at the outset of the process. Dr. Nancy Doyle is a prolific campaigner for neurodivergence in the workplace who has previously written an online opinion piece for Genius Within, a UK community interest company, on the subject of the Sir Charlie Mayfield Review (Doyle, 2025). The Mayfield Review and the work of Miller and Doyle (2025) will feature throughout this dissertation.

The aforementioned is important for several reasons, not least for the intrinsic motivation of the employee but also on grounds of fairness and positive discrimination. I am aiming to study how neurodiverse applicants perceive SHRM and how SHRM approaches, which are inherently focused on creating competitive advantage link to recruitment signalling during the applicant journey. I am hoping to investigate several, which will form the backbone of the research study, and which will either confirm the work of Miller and Doyle (2025) or reject the premise of their recent research study using a deductive methodology. I also plan to extend Miller and Doyle's work to study anonymous responses from neurotypical and neurodiverse applicants.

1.11.1 Designing Participant Research Using Structural Estimation

The central research question of the MSc dissertation thesis can be sub-divided into four individually-defined research questions. Each sub-question is compartmentalized (inclusive of lemmas and proofs) and informs the hypothetical assumption that guides the central research question. Of course, much of the theoretical scope which these questions fall under are mathematical intensive lemmas and proofs. The essence here is that prior to the allocation of regression P-values, confirmation is required about the inter-relationships between important systems of variables that are referenced as sources in 1.13.1. The following is the survey format as found in a GitHub repository created using Heroku deployment method and Visual Studio IDE: <https://alfredmayaki.me/msc-survey.html>.

“For each question below (as seen in the msc-survey.html frontend), except the final one, Claude Opus 4.6 built and generated a 10-point Likert Scale for the dissertation project with a survey range from 1 to 10 where 1 is equal to ‘strongly disagree’ and 10 is equal to ‘strongly agree’. The nature of the question remained consistent, rather what changed was a series of text boxes which were converted to Likert Scales to reflect the changes made. This was done for all except the final question. The existing template research survey questions as found in Miller and Doyle (2025):

1. What attracts you to an organization?
2. How do you perceive if a potential employer is inclusive during recruitment?
3. How does this impact you?
4. What was your experience of applying to your current organization?
5. Do you have other experiences that have been the same, or different?
6. Do you disclose your neurodivergence during recruitment?
7. What has been your experience of disclosing or not disclosing?
8. What has been your experience of adjustments during recruitment?
9. When you have been at your best during recruitment, that's like what?
10. How did the organization help you do your best?

What the survey consists of: CSS Modernization

- Cards: White background with a blue left accent border, subtle shadow, hover lift effect, and staggered slide-in animation
- Labels: Slightly larger font with better line-height
- Question badges: Numbered blue circle badges (.q-number) before each question
- Likert scale: Circular selectable dots (1–10) with hover highlights and checked state (brand blue with shadow glow)
- Progress bar: Gradient-filled bar tracking completion of the 10 Likert questions

- Responsive: Smaller dots and tighter spacing on mobile ($\leq 600\text{px}$)

What the survey consists of: Form Restructuring

- Flattened layout: All 11 questions are now individual cards (no more nested sub-questions)
- Questions 1–10: Converted from text areas to 10-point Likert scales (1 = Strongly Disagree $\rightarrow$ 10 = Strongly Agree)
- Question 11 ("Anything else you want to share?"): Kept as an open-ended text area
- Instruction text: Added above the form explaining the scale
- Thank-you note: Added before the submit button

What the survey consists of: JavaScript Updates

- Validation: Checks all 10 Likert fields are answered before submission
- Data collection: Stores Likert values as integers (`parseInt`) and Q11 as text
- Progress tracking: Real-time progress bar updates as radio buttons are selected, resets on form submission

Though, the nature of the new format remains consistent with Miller and Doyle (2025) after a transformation from open format to closed, the interrogation format was ultimately changed from to better quantify experiences of neurodiverse employees. The new ten new questions are scaled from 1-10, relative to Miller and Doyle (2025)'s more qualitative research approach. The strength of this is it allows structural estimates to be derived when we embed these survey variables into an objective function (a social contract constrained maximisation problem).

1. What attracts you to an organization?
 - a. *Changes to* - I am attracted by the offer of interview accommodation when applying.
2. How do you perceive if a potential employer is inclusive during recruitment?
 - a. *Changes to* - I am increasingly aware of inclusive wording and the behaviours of recruiters.
3. How does this impact you?
 - a. *Changes to* - These impact me in a positive way.
4. What was your experience of applying to your current organization?
 - a. *Changes to* - My experience of applying to my current organization was enjoyable.
5. Do you have other experiences that have been the same, or different?
 - a. *Changes to* - I have had other enjoyable experiences that have been similar.
6. Do you disclose your neurodivergence during recruitment?
 - a. *Changes to* - I am happy to disclose my neurodivergence during recruitment processes.
7. What has been your experience of disclosing or not disclosing?
 - a. *Changes to* - My experience of disclosure has been amicable.
8. What has been your experience of adjustments during recruitment?

-
- a. *Changes to* - My experience of adjustments made during recruitment have been reasonable.
 9. When you have been at your best during recruitment, that's like what?
 - a. *Changes to* - To perform my best during a job interview, I require a specific adjustment.
(Please state the specific adjustment you require during interview in your last response)
 10. How did the organization help you do your best?
 - a. *Changes to* - My organization helps me to perform my best.
 11. Anything else you want to share?

In terms of key variables, it was assumed that two key variables emerged as primary sources from this survey in the objective function, the measure of job 'attractiveness'. The depression scale emerged as a secondary source of data. This thesis now turns its attention to the structural model (as opposed to a reduced form model) and its associated inferences mentioned above. These inferences, or assumptions, in part form questions which in turn are separate to the primary research questions and are secondary in nature.

1.11.2 On Pareto-Optimal Signalling

1.11.2: What is the sub-game Pareto-optimal signal (in a game of separating or pooling equilibrium (Kolotilin, 2024)) an employer should send to all applicants in order to be neuroinclusive? Also, at what level of signal does an employer who signals acceptance of a neurodiverse condition, become accepted by a neurodiverse applicant?

1.11.3 On Necessary and Sufficient Scales of Inclusive Effort

1.11.3: What proportion of exertion should be given to ensure reasonable adjustments are afforded to all neurodiverse applicants who are successful during the interview process and what proportion of exertion should be afforded to ensuring a plurality of ethnicities are duly and adequate engaged within that very same recruitment process?

1.11.4 On Kolotilin and the Many-To-One Equilibria

1.11.4: In a separating equilibrium with known payoffs, and standard assumptions (complete information and perfect monitoring), how do employers successfully navigate a many-to-one “lottery” scenario, using the offered wage as an optimal signal or as a navigating mechanism?

1.11.5 On the Transformative Role of Artificial Intelligence

1.11.5: Can the use of artificial intelligence inspire a Nash outcome to occur that is Pareto-optimal, where the set wage and a signal for a neuroinclusive working environment are both revealed by the employer and accepted by the applicant?

1.12 Justification for Selecting Topic

Given that recent research demonstrates how neuroinclusive teams can be 30% more productive than those which do not include neurodiverse employees (NatWest Mentor, 2025), and with Gen Z entering the workforce – over 50% of whom have some sort of neurodivergent condition² - either Autism Spectrum Disorder or Bipolar Disorder (Forbes Magazine, 2025), the broad research topic I have selected to follow for this module is a contemporary problem with its roots in a recent report (Youth Future's Foundation, 2025). As an interdisciplinary topic, this thesis is partly covered by *signalling* (psychology), *applicant attraction* (HRM), *employee wellbeing* (HRM) and *labour market analysis* (game theory).

² This thesis defines three specific conditions in-scope of the study: ADHD, Autism and Bipolar Disorder.

As I am deeply intrigued by the sort of opportunities available to young and neurodiverse adult applicants and how these opportunities are perceived by those who apply, I have chosen a topic that investigates an instance and prevalent gap in the literature on hiring technology and perceptions of recruitment processes by neurodiverse applicants (Miller and Doyle, 2025). I have devised a set of five hypothesis to outline the direction which I would like the research to follow, and which resulted in the research question I have settled on.

1.12.1 Strategic Human Resource Management

[Strategic HRM is an area of contentious theoretical contributions that form the HRM canon]

1.12.2 Signalling Theory

[Signalling Theory is the brainchild of Spence (1973)]

1.13 Applied and Mathematical Research Methods

From the very outset I will be aiming to utilise a deductive approach for this MSc in HRM research study (which incorporates sentiment analysis and an open-ended questionnaire to answer the question as to how neurodiverse applicants and employees can best be catered for in) by conducting empirical analysis of a diverse range of datasets including non-sensitive HR data. The research questionnaire is available (in draft) to view in subsection 1.11.1 and resumes the research topic where (Miller and Doyle, 2025) vacated, although the topic of discussion has been realigned to include artificial intelligence, the fundamental assertions are the same. The following hypotheses are subject to supervisory changes and will be honed and amended as and when new information in the literature is discovered, reviewed and internalised. In order, these initial hypotheses read as follows:

Hypothesis 1: Neurodiverse workers apply only to firms who signal intent to accommodate.

Hypothesis 2: Firms choose to allocate resources between signalling neurodiversity and DEI initiatives.

Hypothesis 3: Firms signalling higher average wages tend to be less neuroinclusive.

Hypothesis 4: Firms harnessing the power of AI can achieve high wages *and* be optimally neuroinclusive.

1.13.1 Sources of Relevant Data and Information

Data sources for this project will use data from Understanding Society (UKHLS), the Life Opportunities Survey (Waves 1-3); and the OECD Employment & Labour Market Statistics (each dataset from 2010-2015). Selected variables: 'jbatt' which is a variable proxy representing the survey response concerning the question about the main attraction of one's current job, 'jwbs2_dv' which is a job-related depression scale, and finally

a variable proxy for 'social contract' which is derived from the Life Opportunities Survey, where the respondent identifies if they have a health condition, impairment or other SS (this is part of a longitudinal dataset).

Table 1: Modelling Structural Data Using Variables

Optimal For Employees	Representation
Main attraction of current job	J_i
Job Depression scale (Dependent var)	D_i
Social contract (health condition)	S_i
Length of sickness absence	L_i

Other selected variables: We assume the employer observes productivity of current workers, profitability of their business unit, and thereafter sets its offered wage above the market wage as this is a proven method of ensuring the avoidance of workers who are likely to shirk or who signal low productivity levels (Shapiro and Stiglitz, 1984).

Table 2: Modelling Structural Data Using Variables

Optimal For Employers	Representation
New worker productivity signal	U_i
Profitability of firm F	H_i^*
Wage level of firm F	W_i

1.14 The Topic's Importance to the Literature

The importance of the research survey cannot be understated. Specifically, the topic is important because it seeks to enquire into how diverse job applicants perceive their roles in the organization *prior to* being onboarded as employees (in other words, it asks how *neurodiverse* applicants interact as job candidates) through the proxy of website recruiting activities. The seminal applied instance of this research topic is the online ratings and HRM signalling paper pioneered by Chang and Chin (2018) who test evidence to investigate the hypothesis that three things are likely to occur prior to onboarding:

1. A high-commitment HRM strategy is pursued and that firms conduct recruitment online via a website.
2. The firm may initiate a signal to the receiver via a website. Such a signal concerns the nature of its high-commitment HRM strategy.
3. This signal initiates an effect on the employees' online ratings.

1.14.1 Regressing via Two-Stage Least Squares

My research will aim to extend a gap on this topic by focusing on firm expenditure, capabilities, and resources, asking a question not currently addressed by the literature on signalling – how these factors affect competitive advantage given the specific context of attribution theory (Guest, 2021).

The constraint is set to ensure the dependent variable, the job-related depression scale (D_i), never exceeds the social contract for Firm F. Rather, the scale's boundary condition is a set of solutions which are locally optimal.

In this equation, the measure of depression D must not exceed what one may refer to as the “threshold” for the social contract S .

If one takes the partial derivatives of the Lagrangian and computes each of the four KKT first-order conditions (*stationarity, primal feasibility, dual feasibility and complementary slackness*) for all key variables in the maximisation problem (W , S , D and U) and λ , one can arrive at the local optima necessary to fulfil the boundary condition.

Here, it is possible to integrate datasets from various third-party sources such as the ONS, Understanding Society and the Labour Force Survey, what then can the relationship be argued to be between employer and the interests of the applicant or employee?

This paper defines a set of simultaneous equations such that firm F's objective function $F(x)$ is equal to the net productivity gains of the worker balanced by the constraint of qualitative cost, that is, maintaining a healthy, non-shirking workforce. These shall be referred to as ‘boundary conditions’, along which the worker has an incentive to not shirk, which in turn ensures the firm is a benefactor of a productive workforce.

$$(1.14.2) \quad L_i = W_i \cdot (1 - D_i) \cdot J_i$$

Rearranging the 1st equation to re-represent the depression scale as the dependent variable, we arrive at:

$$(1.14.2.1) \quad D_i = 1 - L_i/(W_i \cdot J_i) \text{ such that } 1 - D_i \geq 0$$

Proof: The constraint is set to ensure the dependent variable, the job-related depression scale (D_i), never exceeds the social contract for Firm F. Rather, the scale's boundary condition is a set of solutions which are locally optimal. As the offered wage (W_i) and the main attraction of the job (J_i) increase, the value being

subtracted from 1 will decrease, potentially lowering the depression scale score, provided sickness absence (L_i) is controlled. The constraint ensures the model remains locally optimal, serving as a "social contract" where the worker has an incentive not to shirk, thereby ensuring the firm benefits from a productive workforce.

$$(1.14.2.2) \quad W_i = (1 - U_i) \cdot H_i^* \text{ such that } 1 - U_i \geq 0$$

Proof: Here, I define the wage level (W_i) as a function of the new worker's productivity signal (U_i) and the firm's profitability (H_i^*). The constraint in 1.14.2.2 acts as a boundary condition for the employer's side of the objective function, balancing net productivity gains against the cost of maintaining a healthy workforce.

Optimising the system locally, taking partial derivatives:

$$(1.14.3)$$

Substituting the second simultaneous equation into the first to derive the equilibrium conditions:

$$(1.14.4)$$

The two-stage-least-squared (2SLS) regression model is defined as the dependent variable: Y representing the depression scale, the intercept β_0 , the observed Likert Scale variable (job attractiveness) and its estimator β_1 and X_1 , and finally the residual or error term, ε .

$$(1.14.5) \quad Y = \beta_0 + \beta_1 X_1 + \varepsilon$$

The authors (Chang and Chin, 2018) argue for five important hypotheses which form the starting point for this study:

- 1) Firms with more high-commitment HRM will signal more HRM information on websites.
- 2) Firms signalling more HRM information on websites will experience a trend of more applications.
- 3) Firms' signalling of HRM information on websites fully mediates the effect of the firms' commitment HRM on recruitment.
- 4) Firms' *actual* HRM influences employees after experience outcomes such that firms' commitment HRM will increase online ratings.
- 5) Firms' signalling of HRM will not increase an employees' online ratings if the effect of commitment HRM (on recruitment) is controlled.

My research will aim to extend a gap on this topic by focusing on firm expenditure, capabilities, and resources, asking a question not currently addressed by the literature on signalling – how these factors affect competitive advantage given the specific context of attribution theory (Guest, 2021).

1.15 Timeline for Completion and Next Steps

Out of scope: I will be conducting a theoretically-organised literature review for B894 which will be completed in February 2026, I do not intend to look at any sort of data or make any requests for data access until ethical approval has been given for my MSc research question and methodological design. I also do not intend to commence on the Results or Discussion chapter.

Within Scope: I will begin to map the hypotheses using data sources such as Overton.io and others that have been identified; and assuming the research question can be scrutinised on an ongoing basis, it will then be possible to review the available literature, filter through and arrange such information into formats which will allow me to revise the hypotheses (cited above), and hopefully make use of both quantitative methods and indeed qualitative analysis such as a survey or questionnaire.

The TMA 2 assignment begins here

1.16 Literature Review

As SHRM (specifically, RBV) is a very interdisciplinary subject when it comes to research that defines theory – this thesis will source information on the following subtopics from three exceptionally reliable contemporary literature sources (EBSCOhost Research Databases, JSTOR, Open University Library and Google Scholar). My intention is to source academic peer-reviewed literature published roughly between 2010 – 2025 in terms of timelines (the literature effectively narrates on the problem which can be traced back to about 2011 in reports so, there's about a 8–10-year gap where the problem surfaces and the seminal papers focused on analysing the problem begin to emerge in the literature). However, there may be exceptions to this timeline as per the theoretical work of Coles and Treble (1993) or the earlier theoretical work by Rynes and Barber (1990). Though the three selected sources indeed do store great literature on each subtopic, I may require policy infographics, charts and vital published statistics which will also be important to this study's objective. I will therefore be actively seeking NGO and government reports drawn from Overton.io, where such information may be found.

1.17 Mapping Relevant Subtopics

1.17.1 Signalling Theory: The seminal work on signalling theory can be found in Spence (1973) however, since Spence's paper was published there have been numerous attempts to assign and apply signalling theory to the context of the hiring process.

Strategic Human Resource Management: A recent study on applicant attraction by Dutta and Mishra (2021) have focused on Gen-Z and millennial generation cohorts in the context of the Indian sub-continent.

Neurodivergent Job Opportunities: According to Sir Robert Buckland's Autism and Employment Review published alongside Autistica on the employment of Autism sufferers on the ASD spectrum, only 3 in 10 people with ASD are gainfully employed, the remaining 7 in 10 of the UK's population are unemployed or underemployed. This figure rises to 8 in 10 on a worldwide basis (Davies et. al. 2023). The Buckland Review has come under criticism for not aligning or comprehensively considering the frictions of matching theory (Pissarides, 2017).

1.18 Gap Analysis: Perfect Equilibrium Models

The gap in the signalling literature is not very vast but extends to recent work by Kolotilin *et. al.* (2024) and his formal proofs with application to media censorship. There is little or no example in Kolotilin *et. al.* (2024) of any structural estimation via survey evidence achieved through primary research. The work of van Damme and Guth (1989) and thereafter van Damme and Guth (1991) refers explicitly to Spence (1973) in a model

focused on perfect equilibria and, as previously demonstrated in Mayaki (2024) via 'disagreement points', and in what van Damme and Guth refer to as 'uniformly perfect equilibria', worker and firm frictions are a significant element to equilibrium search and matching models.

1.19 Organising the Literature Review

As part of the planning process, I shall spend time gathering articles from a number of relevant online databases which host peer-reviewed journals. These are listed below under the "Source" column. I plan to gather a minimum of five articles from each of the clear *subtopics*, acting as search protocol and using the jigsaw format as structure (University of Hull Library, 2025).

How does signalling affect a strategic HRM approach? Roehl stipulates this contention is analogous to the conflict as seen in psychological contract theory, arguing that an organization's signal – through its communications strategy (Eppler *et.al.*, 2026) and its choice of HR system, can have a variation of impacts on the perception of the employee (Roehl, 2019). Familiar themes from Roehl (2019)'s article:

- The notion that SHRM can influence attitudinal and behavioural reactions (Lepak *et. al* and Bowen and Ostroff) is analogous to the findings of an article by Morris *et. al.* (1993) on attitudinal and behavioural commitments.

1.19.1 Sufficient Signalling Given Neurodiverse Conditions

[This paper begins with a general overview of how SHRM signalling serves the needs of adults with Autism.]

1.19.2 Signalling in the Context of the ‘Many-to-One’ Hiring Lottery

Here, in the view of Spence (1973) the notion of hiring is made analogous to the rationale of purchasing a ticket for a lottery draw, which itself is a problematic notion due to the euphemisms of risk, value and eventual loss being invoked. This rationale of adopting such a gamble is best described per a model composed by Brown and Sessions (2004). Spence argues that there is often an element of informational asymmetry pertaining to full knowledge of the average worker’s capability in the job prior to such a lottery concept being invoked. Assuming the lottery concept is associated with information that is rarely fully disseminated, an employer’s perception of this lottery gamble is what Spence (1973) defines as a “primary interest” due to the uncertainty involved in making the proposed hire when weighed against the wages offered by the employer to the worker as compensation for services rendered. When discussing the lottery, we speak here of a singular instance of a repeated game. The terms of reference adhered to by Spence, constitute very strict and formal belief system for his term sheet mapping the employer’s perception of the lottery process. There are two kinds of observable attributes mentioned in Spence’s article: Indices and signals (Spence, 1973; p. 357). The term “indices” refers to “immutable” attributes observed by the employer amongst participants in the hiring ‘lottery’, attributes such as race or sex. This is followed closely by the term “signals”, which references alterable attributes or those which can be manipulated by the candidate, such as education and experience. For the purposes of Spence’s research, age is considered as an alterable attribute and is therefore seen to be an index. Signals and indices are seen to be “parameters” in the conditional probability distribution reflecting the “beliefs” of an employer.

Navigating this landscape of DEI in recruitment can be oftentimes a complex pursuit. Upon reflection with some experience and exposure to high-level dialogue gained through the Business in the Community (BITC) Opening Doors program, its fair and proper to infer proportionality. By this, I mean the idea that work is a lottery is not an appropriate lens to view employment dynamics. Much of the work found in the recommendations of the 2024 Autistica report authored in collaboration with Sir Robert Buckland KC can be supported by academic literature. If the Autistica report identifies the scenarios and problem faced by

Autistic job applicants, then Miller and Doyle (2025) most certainly shed further light on this problematisation of a many-to-one 'lottery' scenario by providing what one might call a dialectical synthesis to the concerns highlighted in the report. According to Miller and Doyle (2025) the article mentions the theoretical framework of Khan et. al. (2023) whose literature review and empirical study on the topic is the only post-COVID era work used as authority, but the article also acknowledges that research in the area of inclusive signalling to neurodiverse applicants is relatively limited. When extending Khan et. al. (2023)'s ideas for further research in a HR context, Miller and Doyle (2025) apply a systems-based analysis of "signalling" theory (or rather a systematic approach based on academic literature) in the hiring and selection process to uncover a consummate view that the inclusion of the neurodiverse job applicant in the workplace is paramount. Both co-authors argue organisations should go *beyond* the business case for diversity in recruitment by making the process itself clearer.

One can divide the approach for achieving such an eventuality as follows. Firstly, Miller and Doyle treatise an argument in favour of neuroinclusive approaches by encouraging proactivity from the employer. The line of thinking goes: If an employer provides a list of 'frequently requested adjustments' then this action is therefore a proactive signal to candidates who may require such adjustments to participate in the process. A great example of how a high-growth firm's neurodiversity hiring approach can eliminate the bias of the interviewer, recruiter or hiring manager comes in the form of Microsoft recruitment and workplace accommodations (Microsoft, 2026). Likewise, by sufficiently educating recruitment staff and hiring managers involved in the act of recruitment and selection on what "neurodivergent *behaviours*" are, and by thereafter implementing a follow-up action: prioritising diversity, equity and inclusion over the Spencian view of hiring as a lottery, we arrive at a mechanism which appreciates neurodiversity as a recruitment priority. Critiques may argue this may create a consequentialist dependence on prior training investment.

1.19.3 Multi-Level Analyses and Consequential Outcomes

In contrast to Miller and Doyle's pragmatism on the subject of signalling approaches, Celani and Singh (2011) have conducted an analysis of signalling theory from a multi-level perspective (with the use of 'contextual effects'). By multi-level, or multi-hierarchical (affecting various modes of the organisation; navigating the macro-level, the meso-level, through to the individual-level) the assessment of how recruitment-related signals is seen to reveal unknown characteristics of the organization becomes more stratified. The theory posited provides links between individual and organisation-level signals from recruitment activities. Links are made between market signals and instrumental or symbolic applicant inferences. Celani and Singh (2011) are concerned with outcomes (as opposed to the interest of Davies *et. al.* (2023) for example who are concerned with recruitment *methods* faced by Autistic adults. They therefore take up a consequentialist position (a position which derives itself from the moral philosophy of consequentialism). By introducing their topic in such a way, Celani and Singh conclude by challenging readers via invitation to study a gap in the signalling

literature ~ signalling from a recruiter perspective i.e. from the organisation's perspective. This means to imply that the organisation (recruiter or hiring manager) does indeed perceive and internalise what Spence (1973) defines as 'alterable' attributes (for instance, the highest level of education signalled by the candidate or the candidate's length of experience/number of promotions or career highlights). Signalling theory when viewed through the Spencian lens is therefore arguably either angst and menace on the one hand or catalyst and predicator on the other.

By contrasting the approaches of Celani and Singh (2011) with that of Miller and Doyle (2025) it is possible to observe how in hindsight both authors take completely opposing perspectives on signalling in the context of neurodiversity. Chang and Chin (2018) on the other hand define signalling less altruistically but as the communication of unique information or rather "the sending out of information that competitors cannot easily imitate" analysing HRM signalling on each firm's website over a three-year period. Signalling therefore becomes important in job markets where numerous employers compete to "*increase market share*". Chang and Chin (2018) stress the importance of firm actions and separating equilibrium (The Open University, 2026).

The work of David Guest has been prominent in HRM literature for well over 30+ years. In Guest (2021), the author studies the staff members of bank branches and primarily defines signalling theory as "communication *by* and *within* an organisation", in contrast to evidence from Laker *et. al.* (2025). Citing Bowen and Ostroff (2004) as part of an integrated framework to study attribution theory, Guest (2021) concludes that signalling theory is to be viewed as a "*distinctive*" approach to the HRM process. He acknowledges limitations of cross-sectional methodology and calls for longitudinal research approaches.

The article by Bowen and Ostroff (2004) is one which touches upon multi-level relationships between HRM and organisational performance through psychological "climate" as an example of higher-order social structures (other examples include organisational culture and organisational role structure, and organisational sensemaking (which is a design thinking principle). (p.205). Bowen and Ostroff (2004) highlight the additional importance of "social context theory" where formal roles are defined by organisational systems and "maintenance subsystems".

1.20 Discussion

Axiology which is the study of the science of value (Bahm, 2021) is indeed an important aspect to consider when developing a theoretical understanding of recruitment. Contextualising and internalising the scientific value of the process requires an understanding of the employer's brand value, and its positioning relative proximity to the preferences of ideal applicants and other organizations.

AI as an umbrella term for concepts machine learning, NLP, computer vision and other key algorithmic concepts. Some gaps certainly do exist in the form of "*minimal information*" available concerning the effects of bipolar depression in later life, one of the more pronounced gaps in the literature is the more recent focus on Artificial Intelligence ("AI") and employment balances for neurodivergent neurotypical applicants (Mirowska and Arsenyan, 2025; Smith *et. al.*, 2025) which assumes the capture of those who suffer from Bipolar I or II. AI has been argued to carry the potential to promote or affect various types of diversity, to avoid the consequence of overexposure to unconscious biases, and to help design more comprehensive signalling approaches to attract talent, recruit and retain new employees and to develop an overarching organisational focus on *cultural* diversity more generally. According to an open access paper by Chilunjika, *et. al.* (2022), gaps exist in the research on AI's application to HRM in the public sector.

1.20.1 The Two Sides of Attraction: Inclusivity as Reciprocal Branding

[With the emergence of AI, attribution theory becomes masked and obscured but equally as problematic.]

1.20.2 Dismantling Archaic Perceptions of Autism in Practice

[With the emergence of AI, attribution theory becomes masked and obscured but equally as problematic.]
